PC Card Slot Types

ISA

AGP

PCI

PCI-X

PCI-E (PCIexpress)

ISA

ISA, or Industry Standard

Architecture, is an 8bit or 16bit parallel bus system that allowed up  to 6 devices to be connected to a PC. Virtually all IBM-compatible PCs made before the Pentium were based on  the ISA (IBM's PC AT) bus. This asynchronous bus architecture uses 16-bit addresses and an 8-MHz clock and handles a  maximum data throughput of 2 MB/s to 3 MB/s.

ISA is the precursor to PCI. Standing for "Industry Standard Architecture" It  was common from the early 1980s to the mid 1990s. ISA was a typically inelegant solution for the time, and  required one to know exactly what one was doing- PnP was rare, even for so called "ISA PnP" peripherals. In  the end, the combination of flexibility, ease of use, and greater capability allowed PCI to supersede ISA.

PCI

The PCI bus

architecture  is a processor-independent bus specification that allows peripherals to access system memory directly without using the CPU. Not only does  this free up the CPU to service other application calls, but PCI users also can simultaneously acquire data to memory  and analyze existing data in real time, all while communicating with other functions on the network.

More importantly, PCI peripherals running  asynchronously can send data along the 32-bit bus at a rate of up to 132 MB/s or 66 MS/s.

AGP

The

Accelerates  Graphics Port is a high-speed point-to-point channel for attaching a video card to a computer's motherboard. It was created in  1997 yet by 2004 was largely replaced by PCI Express. The primary advantage of AGP over PCI is that it  provides a dedicated pathway between the slot and the processor rather than sharing the PCI bus.

In addition to a  lack of contention for the bus, the point-to-point connection allows for higher clock speeds. AGP also uses sideband addressing, meaning  that the address and data buses are separated so the entire packet does not need to be read to get  addressing information. This is done by adding eight extra 8-bit buses which allow the graphics controller to issue new AGP  requests and commands at the same time with other AGP data flowing via the main 32 address/data (AD) lines. This  results in improved overall AGP data throughput.

PCI-X

PCI-X stands for "PCI-eXtended". PCI-X is a computer bus and expansion card standard that  enhances the 32-bit PCI Local Bus for higher bandwidth demanded by servers. It is a double-wide version of PCI, running  at up to four times the clock speed, but is otherwise similar in electrical implementation and uses the same protocol.[1]  It has itself been replaced in modern designs by the similar-sounding PCI Express, which features a very different logical design,  most notably being a "narrow but fast" serial connection instead of a "wide but slow" parallel connection.

PCI-X revised the conventional  PCI standard by doubling the maximum clock speed (from 66 MHz to 133 MHz)[1] and hence the amount of data  exchanged between the computer processor and peripherals. Conventional PCI supports up to 64 bits at 66 MHz (though anything above  32 bits at 33 MHz is only seen in high-end systems) and additional bus standards move 32 bits at 66  MHz or 64 bits at 33 MHz. The theoretical maximum amount of data exchanged between the processor and peripherals with  PCI-X is 1.06 GB/s, compared to 133 MB/s with standard PCI. PCI-X also improves the fault tolerance of PCI allowing,  for example, faulty cards to be reinitialized or taken offline.

PCI Express

PCIe, or Peripheral Component Interconnect Express, is a computer expansion  card standard designed to replace the older PCI, PCI-X, and AGP standards. PCI Express is used in consumer, server, and  industrial applications, as a motherboard-level interconnect (to link motherboard-mounted peripherals) and as an expansion card interface for add-in boards. A  key difference between PCIe and earlier buses is a topology based on point-to-point serial links, rather than a shared parallel  bus architecture.

Bandwidth

Below is a table showing the different buses/card slot types and their maximum bandwidths:

PCI 132 MB/s AGP 8X 2,100  MB/s PCI Express 1x 250 [500]* MB/s PCI Express 2x 500 [1000]* MB/s PCI Express 4x 1000 [2000]* MB/s PCI  Express 8x 2000 [4000]* MB/s PCI Express 16x 4000 [8000]* MB/s PCI Express 32x 8000 [16000]* MB/s USB 2.0 (Max  Possible) 60 MB/s IDE (ATA100) 100 MB/s IDE (ATA133) 133 MB/s SATA 150 MB/s SATA II 300 MB/s Gigabit Ethernet  125 MB/s IEEE1394B [Firewire 800] ~100 MB/s*

* Note - Since PCI Express is a serial based technology, data can be  sent over the bus in two directions at once. Normal PCI is Parallel, and as such all data goes in  one direction around the loop.

Charles do Bronx é um lutador de MMA profissional de grande prestígio, reconhecido internacionalmente por bet pix com participação no UFC. Atualmente,  ele compete na categoria de pesos-leves e já foi campeão nesta divisão.

Um Lutador Consagrado

Charles do Bronx é um dos lutadores mais bem-pagos no UFC, com um salário anual estimado em bet pix com US$2 milhões. Já participou de diversas competições e eventos, sempre despertando a atenção dos fãs e entusiastas de MMA. Em 280 do UFC, ele enfrentou Islam Makhachev em bet pix com uma luta disputada pelo cinturão dos leves.

O Futuro do Bronx no MMA

Após uma derrota, Charles do Bronx permanece um jogador importante e admirado na cena do MMA. Atualmente, ele ocupa o 4º lugar no ranking peso-por-peso da UFC, tendo ultrapassado o campeão peso-pesado Francis Ngannou. Além disso, anunciou uma parceria com o Corinthians, tanto como embaixador quanto patrocinador, aumentando its visibilidade e significado na comunidade do clube esportivo.

# Misteriosos homicidios de surfistas en México

El asesinato de los hermanos australianos Callum y Jake Robinson y su amigo estadounidense, Jack Carter Rhoad, han destacado las líneas de conflicto cambiantes y poco claras de riesgo en México. Al mismo tiempo, es un importante destino turístico y un país con puntos calientes de una extrema violencia.

La pareja y Rhoad, quienes en abril desaparecieron en el estado costero del Pacífico de Baja California durante un viaje de surf, fueron encontrados más tarde muertos, cada uno asesinado por un disparo en la cabeza. Las autoridades mexicanas creen que fueron atacados por personas que querían robarles las llantas del auto y fueron asesinados al resistirse.

### Relacionado: Los surfistas desaparecidos murieron por disparos después de intento de robo, dicen las autoridades mexicanas

El hombre acusado de los homicidios, Jesús Gerardo conocido como "El Kekas", está actualmente bajo custodia, con cargos de asesinato esperados para ser presentados. Su novia, quien también fue arrestada, ha informado que él le dijo "Los maté", le dio un teléfono móvil y le mostró las llantas supuestamente robadas en su coche.

Los asesinatos son parte de la violencia que afecta a México, el cual en 2024 vio más de 30,000 homicidios por sexto año consecutivo. Más de 100,000 personas también siguen desaparecidas.

Sin embargo, debajo de las estadísticas nacionales, la violencia está altamente concentrada en ciertos estados.

"Baja California es uno de ellos – pero incluso allí la mayoría de los homicidios ocurren en Tijuana, y mayormente en las áreas pobres," dijo Falko Ernst, analista de México para el grupo sin fines de lucro Crisis Group.

La violencia en Baja California refleja el enorme volumen del negocio criminal en el estado, pero también la inestabilidad del sistema criminal en sí.

Tijuana es la ciudad fronteriza más grande de México, lo que significa grandes flujos de personas, bienes y efectivo que van y vienen de los EE.UU. todos los días. Eso hace que Tijuana sea en sí misma un premio para controlar, con un gran mercado local de drogas y oportunidades para el lavado de dinero.

Los grupos del crimen organizado también tienen un interés en otras partes del estado, por

ejemplo, el puerto en Ensenada – la ciudad más cercana  a donde se encontraron los cuerpos de los turistas – el cual trae en drogas y precursores químicos para sintéticos  como el fentanilo y el crystal meth.

Muchos grupos luchan para controlar estos territorios y negocios en Baja California.

"Tijuana es un  emblema de la fragmentación del crimen organizado, donde no tienes un grupo que controle las riendas, sino muchos," dijo Ernst.

Esto  se ha vuelto más letal por la avalancha de armas de fuego fabricadas en EE.UU. traficadas más allá de la  frontera a México, dijo Victoria Dittmar, investigadora de Insight Crime.
